

THE NOBODY NETWORK

CabalMesh

A wallet whose payments survive with no internet — sign an intent on your phone, relay it through the phones around you, settle it on Avalanche the moment any of them finds a signal.

CABAL MESH V1.0

THE PROBLEM

Every payment rail on earth assumes a live connection — so when the network drops, value stops moving.

2.2B

PEOPLE

are still offline in 2025 — 96% of them in low- and middle-income countries.

ITU, Facts and Figures 2025

3.1B

THE USAGE GAP

live under mobile coverage they do not use — 38% of the world's population.

GSMA, State of Mobile Internet Connectivity 2025

300M

THE COVERAGE GAP

have no mobile internet coverage available to them at all.

GSMA, State of Mobile Internet Connectivity 2025

And coverage is not availability: outages, disasters, borders, crowds and dead zones take the network away from everyone else, exactly when local coordination matters most.

THE SOLUTION

CabalMesh is a zero-identity wallet that settles offline transactions through the people around you.

01

**SIGN**

Compose and sign on-device. No account, no server, no session.

02

**RELAY**

Nearby phones carry the encrypted payload over Bluetooth and mesh.

03

**GATEWAY**

The first peer with internet drains the queue toward the chain.

04

**SETTLE**

Escrow confirms on Avalanche.
The proof lands; the identity never does.

IT ALREADY WORKS

The offline path is built and demonstrated end to end — 470 automated tests, escrow live on Fuji, verified with the radio off.

PRIVACY BY SUBTRACTION

No account, no server, no stored history. There is nothing to leak because nothing is kept — only a proof settles on-chain.

THE NETWORK IS THE MOAT

Every user is a relay, and relaying earns. Density is the product: the more users in a place, the better it works there.

None of this loop is a roadmap item — it runs today on iOS, Android and macOS, and the demo is the app, not a mock.

MARKET

A large, structural need — and two compounding markets already paying for pieces of it.

WHO NEEDS IT

2.2B

offline today

ITU 2025

3.1B

in the usage gap

GSMA 2025

300M

with no coverage

GSMA 2025

WHY THE NEED IS URGENT

Coverage keeps growing while use does not — the gap is behaviour, price and trust, not towers. An offline-first rail does not wait for either curve.

GO TO MARKET · WHAT WE BUILT

Start where the mesh is already dense, then sell the hardware that makes it denser.

BUILT AND RUNNING TODAY

- Offline signing, relay queue, auto-confirm on reconnect
- BLE offline plane on iOS and Android
- Escrow live on Avalanche Fuji — real deployed address
- Vault (AES-256-GCM) + guardian social recovery
- 470 automated tests · desktop and mobile app shipping

WHO USES IT FIRST**01 Avalanche builders & grant circles**

They already see the demo and read the code. Cheapest audience to reach, hardest to fool.

02 Privacy & crypto-hardware buyers

A category that already buys a physical security device — ShadowBox and the Nobody Box are pre-order units.

03 Off-grid, disaster & local trade

The people the offline path was written for. Slowest to reach, highest retention once it works.

MOTION — mesh missions verified on-chain (not just posts) → Kaito mindshare campaign → waitlist → pre-order. Every user is a relay, so growth densifies the network instead of only adding accounts.

WHAT IS BUILT · WHAT EACH PIECE IS FOR

Three pieces are built. Each removes one reason people cannot transact.

LIVE

OFFLINE INTENT

WHAT IT IS FOR

A payment that survives the moment the network does not: signed and queued with the radio off, then broadcast and settled after reconnection — no identity attached.

- ENROL — 5 shares, none a key
- REQUEST — over BLE, unlinkable
- APPROVE — a human, every time
- VETO — 24h window to block
- RESTORE — 3 of 5 rebuild it

LIVE

GUARDIAN RECOVERY

WHAT IT IS FOR

Losing the phone stops being fatal. Three of five guardians rebuild the vault over Bluetooth, each approving by hand — and no server ever holds a key.

CONCEPT · PHASE 2

THE TWO BOXES

WHAT THEY ARE FOR

A node and a locker — the first things we can sell. The ShadowBox relays for the neighbourhood, runs the local model and generates the proof; the Nobody Box is escrow at the front door, a parcel locker whose bolt turns when the deal settles.

TEAM

Who is building it — and how they decide what ships.

FOUNDER · ENGINEERING

kurodenjiro

Wrote the mesh, the BLE offline plane, the vault, guardian recovery and the on-chain settlement path — 74 commits in the first 30 days.

Core team of two to three. Full bios on request.

HOW THIS TEAM WORKS

01 The audit ships with the pitch

A code-read status document lists what does not work, feature by feature, with the file to check.

`docs/product-status.md`

02 The model proposes, Rust signs

AI only produces validated fields. Rust still validates, previews and signs — the safety property holds by construction.

`parse_intent_chat · commands.rs`

03 One true story over three half-built ones

Controls that imply capability we do not have get hidden rather than demoed. The offline path is the one we stake the pitch on.

`CabalMesh-Project-Plan.md` §4

Every claim in this deck points at a file, a contract address or a video. Nothing on these seven slides is a projection.
